

Introduction

Long Version (for Technical Round)

Good morning/afternoon everyone. My name is Sanket Ajay Chopade. I completed my Bachelor of Technology in 2025 from Rashtrasant Tukadoji Maharaj Nagpur University, and I recently worked as a DevOps Engineer Intern at Hisan Labs.

During my internship, I gained hands-on experience with AWS cloud services, Terraform, Docker, Kubernetes, Jenkins, GitHub Actions, and CI/CD automation. I have worked on provisioning cloud infrastructure, managing Amazon EKS clusters, implementing Infrastructure as Code, and building deployment pipelines. I also have exposure to monitoring and observability tools such as Prometheus, Grafana, Datadog, and AWS CloudWatch. Additionally, I have basic exposure to AWS Generative AI services including Amazon Bedrock, Amazon Q Developer, and Amazon SageMaker.

One of my notable projects is a GitOps-based CI/CD delivery pipeline where I used GitHub Actions, Argo CD, Docker, Kubernetes, and Amazon EKS to automate application deployments. I also developed a serverless game hosting platform on AWS EKS with Fargate, implementing secure IAM integrations and load balancing.

One of my key strengths is my eagerness to learn new technologies and solve problems through automation. In my free time, I enjoy exploring cloud-native technologies, working on hands-on DevOps projects, and continuously improving my technical skills.

My career goal is to build a successful career as a DevOps Engineer, where I can contribute to designing scalable, reliable, and automated cloud infrastructure while continuously expanding my expertise in cloud computing, DevOps practices, and emerging technologies.

Thank you.

Short 45-Second Version (for HR Round)

Hello, my name is Sanket Ajay Chopade. I completed my B.Tech in 2025 from Rashtrasant Tukadoji Maharaj Nagpur University and recently worked as a DevOps Engineer Intern at Hisan Labs.

During my internship, I gained hands-on experience with AWS, Terraform, Docker, Kubernetes, Jenkins, GitHub Actions, and CI/CD automation. I worked on deploying applications to Amazon EKS, provisioning infrastructure using Terraform, and implementing monitoring solutions with Prometheus and Grafana.

One of my key projects was building a GitOps based deployment pipeline using GitHub Actions and Argo CD on AWS EKS.

I am a quick learner who enjoys working on cloud and automation technologies, and my goal is to grow as a DevOps Engineer while contributing to scalable and reliable cloud solutions. Thank you.

E-Commerce Application Project – DevOps Internship

During my internship, I worked as a DevOps Intern on a large e-commerce application. Since the company has signed a Non-Disclosure Agreement (NDA) with the client, I cannot share specific details about the project. However, I can describe the overall structure of the application and my role in supporting its development and deployment.

The project was an online shopping platform built using a microservices architecture, where the application was divided into multiple smaller services. This approach helped the team manage, update, and scale different parts of the application more efficiently. The application included a frontend layer for user interaction, a backend layer that handled business operations, and a database layer for storing application data.

The project followed the Agile methodology, where work was completed in sprints. Team members participated in daily meetings to discuss progress, challenges, and upcoming tasks. At the end of each sprint, the team reviewed completed work and prepared for testing and deployment activities.

As a DevOps Intern, I worked under the guidance of a Senior DevOps Engineer and learned how modern software applications are built, deployed, and maintained. My responsibilities included helping manage code repositories, supporting CI/CD pipelines, assisting with cloud resources, working with containers, and monitoring application performance. I also contributed to deployment activities and helped maintain development and testing environments.

The project used several DevOps tools such as GitHub, Jenkins, Docker, Kubernetes, Terraform, and Datadog. The infrastructure was hosted on Amazon Web Services (AWS), where cloud resources were managed and monitored to ensure smooth application operation.

Through this internship, I gained practical experience in automation, cloud computing, deployment processes, infrastructure management, monitoring, and collaboration within a DevOps team. Working closely with experienced engineers helped me strengthen my technical skills and develop a better understanding of how software moves from development to production in a real-world environment.
